REFERENCES

METHODS

Panel formation and conflicts of interest

The chair of the guideline panel was selected by the leadership of IDSA. Fifteen additional panelists comprised the full panel. The panel included clinicians with expertise in infectious diseases, pediatric infectious diseases, surgery, emergency medicine, microbiology, and pharmacology. Panelists were diverse in gender, geographic distribution, and years of clinical experience. Guideline methodologists oversaw all methodological aspects of the guideline development and identified and summarized the scientific evidence for each clinical question. IDSA staff oversaw all administrative and logistic issues related to the guideline panel.

All members of the expert panel complied with the IDSA policy on conflict of interest (COI), which requires disclosure of any financial, intellectual, or other interest that might be construed as constituting an actual, potential, or apparent conflict. Evaluation of such relationships as potential conflicts of

interest was determined by a review process which included assessment by the Standards and Practice Guideline Committee (SPGC) Chair, the SPGC liaison to the Guideline panel and the Board of Directors liaison to the SPGC, and if necessary, the Conflicts of Interests Task Force of the Board. This assessment of disclosed relationships for possible COI was based on the relative weight of the financial relationship (i.e., monetary amount) and the relevance of the relationship (i.e., the degree to which an independent observer might reasonably interpret an association as related to the topic or recommendation of consideration). The reader of these guidelines should be mindful of this when the list of disclosures is reviewed. See the Notes section at the end of this guideline for the disclosures reported to IDSA.

Practice recommendations

Clinical Practice Guidelines are statements that include recommendations intended to optimize patient care by assisting practitioners and patients in making shared decisions about appropriate health care for specific clinical circumstances. These are informed by a systematic review of evidence and an assessment of the benefits and harms of alternative care options [IOM 2011]. The “IDSA Handbook on Clinical Practice Guideline Development” provides more detailed information on the processes followed throughout the development of this guideline [IDSA CPG Handbook].

Review and approval process

Feedback was obtained from five external individual peer expert reviewers as well as the endorsing organizations. The IDSA Standards and Practice Guidelines Subcommittee (SPGS) and Board of Directors reviewed and approved the guideline prior to publication.

Process for updating

IDSA guidelines are regularly reviewed for currency. The need for updates to the guideline is determined by a scan of current literature and the likelihood that any new data would impact the recommendations. Any changes to the guideline will be submitted for review and approval to the appropriate Committees and Board of IDSA.

Clinical questions

Each clinical question was formatted according to the PICO style: Patient/Population (P), Intervention/Indicator (I), Comparator/Control (C), Outcome (O). For each PICO question, outcomes of interest were identified a priori and rated for their relative importance for decision-making.

Literature search

A medical librarian designed the literature searches and MeSH terms for Ovid Medline, Embase, and Cochrane Library. Searches were limited to studies published in English. The initial formal literature searches were performed in July to November 2018, and updated literature searches were conducted in March 2021 and October 2022. To supplement the electronic searches, reference lists of related articles and guidelines were reviewed for relevance.

Study selection

Titles and abstracts were screened in duplicate for all identified citations using Rayyan [Ouzzani 2016]. All potentially relevant citations were subjected to a full-text review, using predefined inclusion and exclusion criteria tailored to meet the specific population, intervention, and comparator of each clinical question. The steps of the literature selection process were supervised and reviewed by a guideline methodologist for the final selection of the relevant articles.

The following eligibility criteria were used:

Inclusion criteria:

- *Patient population*- Adults and children with complicated intra-abdominal infection (cIAI; infection extended beyond visceral organ)
- *Intervention*- Scoring tool
- *Outcomes*- Mortality (prediction of)
- *Study design*- Observational studies reporting on mortality (30±2-day or in-hospital), includes at least 100 patients in study, all risk factors must be available within 24 hours of hospital or ICU admission

Exclusion criteria:

- *Patient population*- Patients with peritoneal dialysis-related peritonitis, cirrhosis-associated spontaneous peritonitis
- *Outcomes*- Mortality related to surgical approach to source control
- *Study design*- Systematic reviews (only primary studies are included), studies reporting univariate analyses only, abstracts and conference proceedings, letters to the editor, editorials, and review articles

Data extraction and analysis

A guideline methodologist in conjunction with panelists extracted the data for each pre-determined patient-important outcome. If a relevant publication was missing raw data for an outcome prioritized by the panel, an attempt was made to contact the author(s) for the missing data. Where applicable, data were pooled using random-effects model (fixed effects model for pooling of rates) using RevMan [RevMan].

Evidence to decision

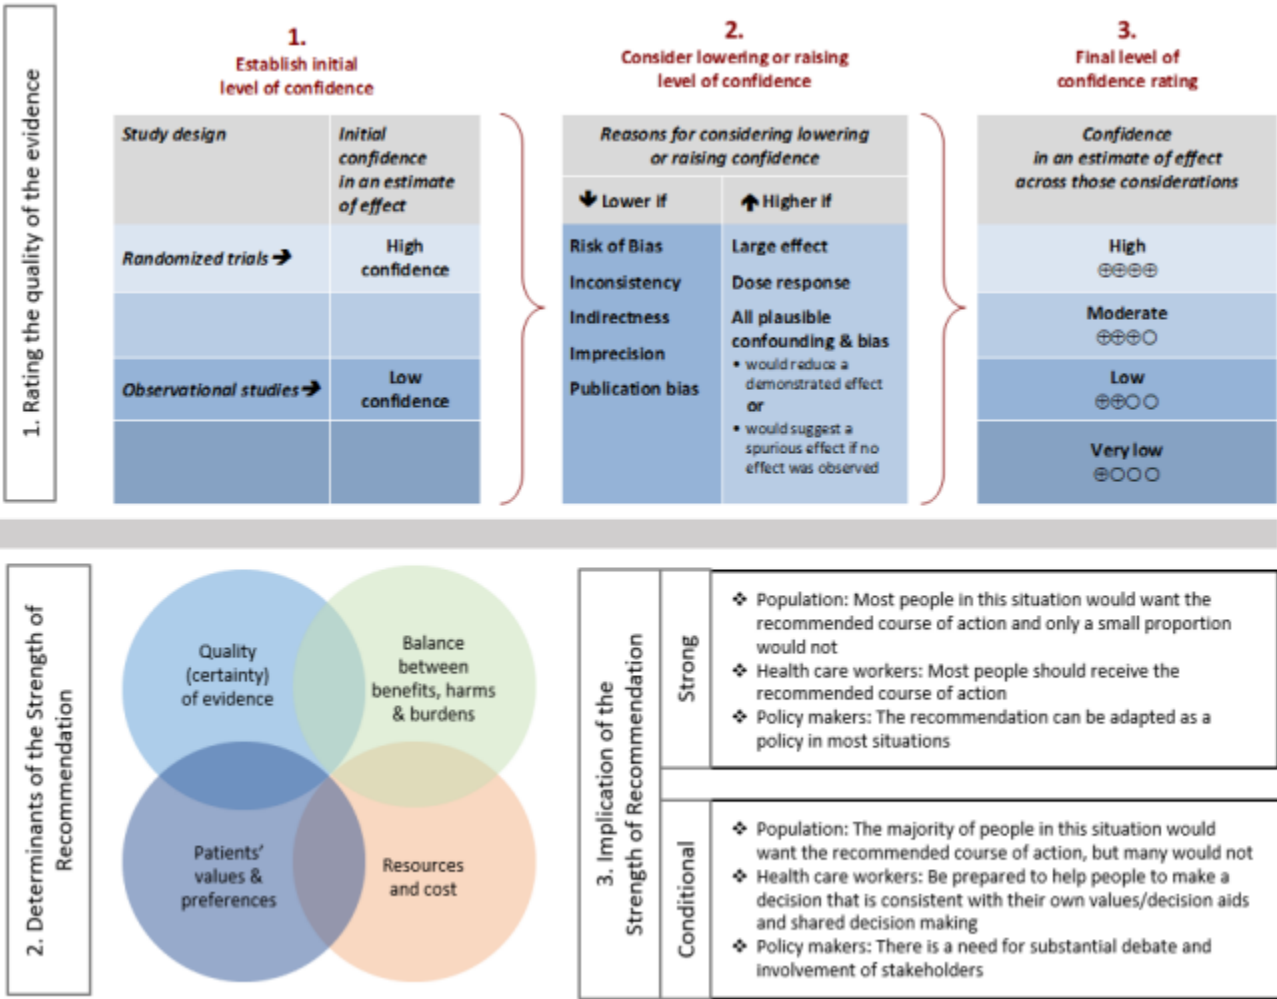

Guideline methodologists prepared the evidence summaries for each question and assessed the risk of bias and the certainty of evidence. Risk of bias was assessed by using the QUIPS tool for studies addressing risk/prognostic factors [Hayden 2013] and the QUADAS-2 tool for diagnostic test accuracy studies [Whiting 2011]. The certainty of evidence was determined first for each critical and important outcome and then for each recommendation using the GRADE approach for rating the confidence in the evidence [Guyatt 2008, GRADE Handbook]. Evidence profiles were developed using the GRADEpro Guideline Development Tool [Guyatt 2008] and reviewed by panel members responsible for each PICO.

The Evidence to Decision framework [GRADEpro] was used to translate the evidence summaries into practice recommendations. All recommendations were labeled as either “strong” or “conditional” according to the GRADE approach [IDSA CPG Handbook]. The words “we recommend” indicate strong recommendations and “we suggest” indicate conditional recommendations. Supplementary Figure 1 provides the suggested interpretation of strong and conditional recommendations for patients, clinicians, and healthcare policymakers. For recommendations where the comparator treatment or tests are not formally stated, the comparison of interest is implicitly referred to as “not using the intervention” (either not using a specific treatment or a diagnostic test).

All members of the panel participated in the preparation of the draft guideline and approved the recommendations.

TABLES AND FIGURES

Supplementary Figure 1. Approach and implications to rating the quality of evidence and strength of recommendations using GRADE methodology (unrestricted use of figure granted by the U.S. GRADE Network)

Supplementary Table 3. GRADE Evidence Profile: Which severity of illness score for risk stratification calculated within 24 hours of hospital or ICU admission best predicts 30-day or in-hospital mortality?

- a. According to QUIPS
- b. Inconsistent results (95% CIs on opposite sides of the null and not overlapping)
- c. Imprecise results (wide 95% CIs)
- d. Imprecise results (95% CI of the pooled point estimate crosses the null)

Forest Plots. Severity of illness scoring system [obtained or calculated] within 24 hours of hospital or ICU admission, 30-day or in-hospital mortality from studies with multivariate analysis

Supplementary Figure 2. APACHE II as a Predictor of Mortality

a) OR, Per Point

*Tellor 2015 used a modified APACHE II score that didn't include Glasgow coma scale.

b) HR, Per Point

c) OR Cutoff

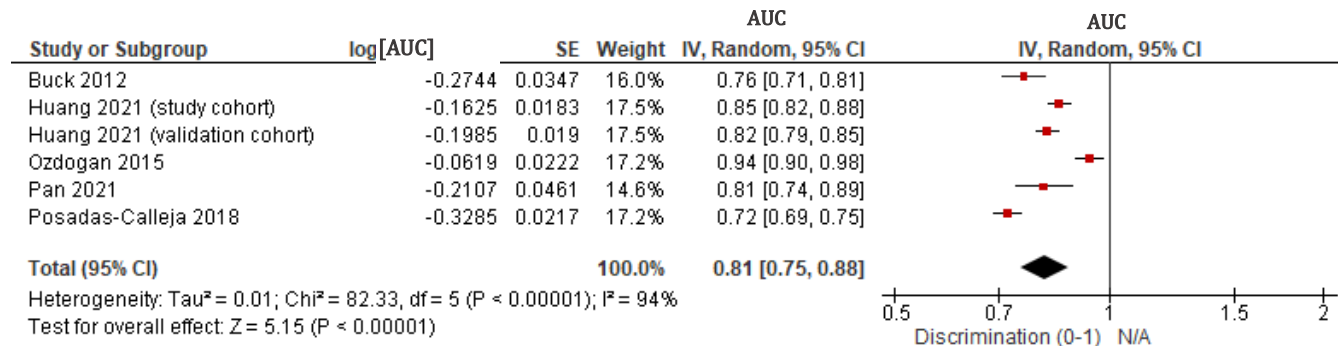

d) RR, Cutoff

Other

Though an OR was not reported by the authors, APACHE II was identified as an independent predictor of mortality in a retrospective study of 544 patients as determined by LASSO multivariate regression analysis of 37 variables [Huang 2021].

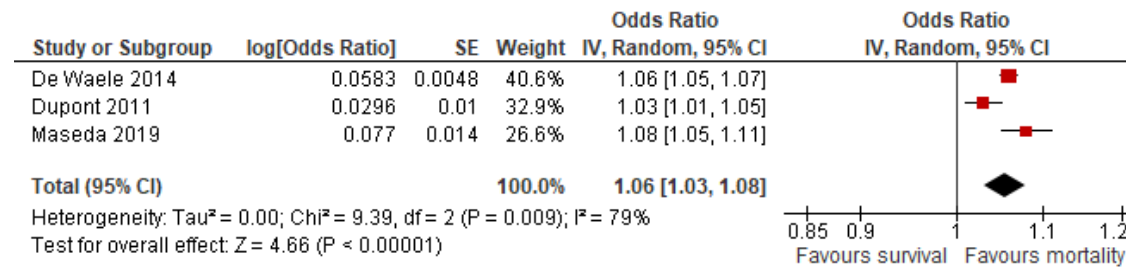

e) AUCs

One additional study [Lebedev 2021] reported an AUC of 0.84 for APACHE II but 95% CI was not provided.

Supplementary Figure 3. SAPS II as a Predictor of Mortality

a) OR, Per Point

b) OR, Cutoff

c) AUC

Supplementary Figure 4. SOFA as a Predictor of Mortality

a) OR, Per Point

b) HR, Per Point

c) OR, Cutoff

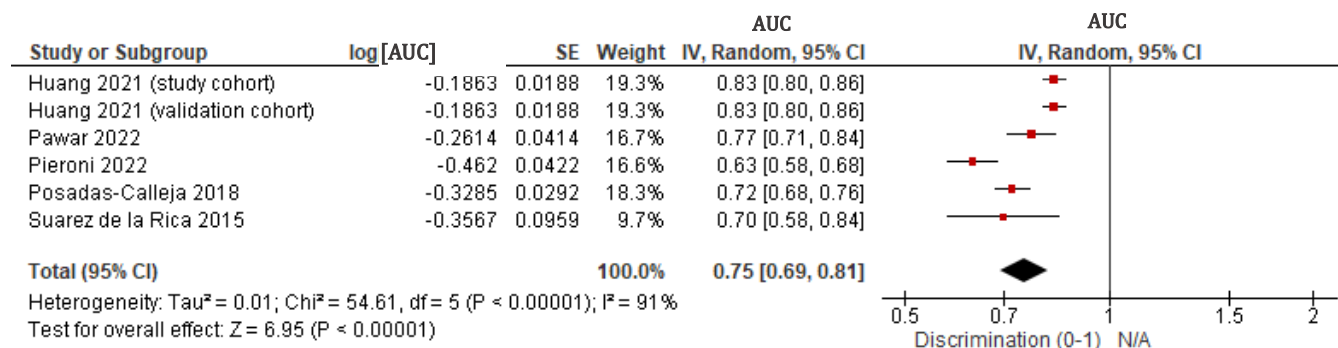

d) HR, Cutoff

Other

Though an OR was not reported by the authors, SOFA was not an independent predictor of mortality in a retrospective study of 544 patients as determined by LASSO multivariate regression analysis of 37 variables [Huang 2021].

e) AUCs

Supplementary Figure 5. ASA as a Predictor of Mortality

a) OR, Per Point

b) OR, Cutoff

c) RR, Cutoff

d) AUC

Supplementary Figure 6. WSES as a Predictor of Mortality

a) OR, Per Point

b) AUC

One additional study [Lebedev 2021] reported an AUC of 0.88 for ASA but 95% CI was not provided.

Supplementary Table 4. Other Independent Risk Factors for Mortality (Multivariate Analysis Only)

| Condition | | No. of studies | Total No. of subjects | Mortality rate (%) | Odds ratio | 95% CI | References |
|-------------------------------|-------------------------------------|----------------|-----------------------|--------------------|------------|-----------|--|

Supplementary Table 1. Characteristics of included studies

| Author, year of publication | Location, years of data collection | Study design | Number of patients and age | Population included | Scoring system(s) | Mortality |
|-----------------------------|--|--|--|---|-------------------|--|
| Abdel-Kader 2019 | UAE 2014-2016 | Retrospective cohort study | 100 adults with cIAI Median age 32 years (range 18-75) | Adults with cIAI who had undergone interventional drainage or surgery for disease management | WSES | Presumably in-hospital mortality: 1% |
| Alqarni 2018 | France 1999-2014 | Retrospective cohort study | 343 ICU patients with postoperative IAI Median 62 years | Post-operative intra-abdominal infections admitted to ICU | SAPS II | All-cause ICU mortality: 31.5%; All-cause hospital mortality: 33.2% |
| Augustin 2020 | France 1998-2012, divided into two 6-year periods | Retrospective cohort study (data collected prospectively) | 251 adults with postoperative peritonitis Mean age for first period 64 years, mean age for second period 62 years | Adults with postoperative peritonitis requiring admission to the ICU | SOFA | ICU mortality: 31.2%; Hospital mortality: 40.2% |
| Bensignor 2018 | France 2004-2013 | Multicenter, retrospective cohort study | 191 patients with postoperative peritonitis Mean age 61 years | Patients with postoperative peritonitis undergoing relaparotomy | ASA | Overall mortality: 14.1% |
| Buck 2012 | Denmark 2008-2009 | Multicenter, retrospective study | 117 adults surgically treated for perforated peptic ulcer Median age 70 years (range 25-92) | Adults with surgically treated perforated peptic ulcer | APACHE II, ASA | 30-day mortality: 17.1% |
| De Waele 2014 | 75 countries Study day in 2007 | Multicenter 1-day point prevalence study | 1,392 adults with IAI Mean age 62 years | Adults with IAI (diagnosed using International Sepsis Forum criteria) | SAPS II | ICU mortality: 20.4%; Hospital mortality: 36.3% |
| Dimitrov 2022 | Bulgaria 2017-2019 | Retrospective study | 110 adults with cIAIs Mean age 61 years | Adults who were operated on for cIAIs | WSES | In-hospital mortality: 22.7% |
| Dupont 2011 | France 1997-2007 | Retrospective cohort study | 160 elderly patients with severe IAI Mean age 82 years | Elderly ICU patients (≥ 75 years) with severe IAI | SAPS II, SOFA | ICU mortality: 47.5% |
| Faes 2021 | Switzerland 2016-2020 | Prospective cohort study | 203 patients Median age 70 years | Patients who had damage-control surgery for severe intra-abdominal sepsis | ASA | In-hospital mortality: 26% |
| Guilbart 2016 | France 2009-2011 | Prospective cohort study | 310 patients with cIAI (both community-acquired and healthcare-associated) Mean age 60 years (range 17-97) | Patients with cIAI | APACHE II | Observed mortality: 10% |
| Huang 2021 | China 2017-2018 | Multicenter retrospective study | 544 adults with cIAI Median age 65 years | Adults diagnosed with cIAI | APACHE II, SOFA | In-hospital mortality: 18.9% |
| Karvellas 2019 | Canada, USA, and Saudi Arabia 1996-2015 | Multicenter retrospective cohort study | 196 adults with acute cholecystitis-associated septic shock Mean age 69.9 years | Cholecystitis-associated septic shock | APACHE II | In-hospital mortality: 37% |
| Konishi 2022 | Japan 2016-2017 | Retrospective cohort study (data from administrative claims data from >1,200 hospitals in Japan) | 3,465 adults Mean age 62.9 years | Patients with gastroduodenal ulcer perforation who underwent surgical repair (in a validation cohort) | ASA | In-hospital mortality: 4.6% |

| | | | | | | |
|--------------------------|------------------------|---|--|--|-----------------|--|
| Lebedev 2021 | Russia Unclear | Retrospective cohort study | 352 patients Mean age 55.8 years | Patients with secondary diffuse peritonitis | WSES, APACHE II | Mortality: 16.7% |
| Li 2017 | Taiwan 2008-2012 | Retrospective cohort study | 133 adults hospitalized with perforated peptic ulcer and subsequent growth of <i>Candida</i> Age (unclear if mean or median) of those without postoperative antifungal therapy 63 years (range 27-89), those with postoperative antifungal therapy 70 years (38-88) | Adults with community-acquired perforated peptic ulcer-associated peritonitis with <i>Candida</i> isolated | APACHE II | 30-day mortality: 12% |
| Lichtenstern 2015 | Germany 2005-2008 | Retrospective cohort study | 283 patients with sepsis due to peritonitis Mean age 64 years | ICU patients with sepsis due to peritonitis (complicated peritonitis) | APACHE II | Overall mortality: 41.3%; 28-day mortality: 29.3% |
| Luo 2022 | China 2011-2018 | Retrospective review | 476 patients Median age 60.5 years | Patients with IAI (community- and healthcare-acquired) admitted to the ICU | SOFA | 28-day mortality: 16% |
| Maseda 2019 | Spain 2014-2015 | Multicenter, prospective cohort study | 345 adults with non-postoperative/non-nosocomial IAI Mean age for healthcare-associated infections 72.5 years, for community-acquired infections 62.3 years, and for immunocompromised 61.0 years | Adults with non-postoperative and non-nosocomial IAIs (healthcare-associated or community-acquired) in the ICU after surgical treatment for infection control | SAPS II | ICU mortality: 8.1%; 30-day mortality: 14.5% |
| Moller 2012 | Denmark 2003-2009 | Retrospective cohort study (data collected prospectively) | 2,668 patients surgically treated for perforated peptic ulcer Median age 70.9 years (range 16.2-104.2) | Patients with gastric or duodenal perforated peptic ulcer patients who underwent surgery | ASA | 30-day mortality: 26.5% |
| Montravers 2016 | France 1999-2011 | Retrospective cohort study (data collected prospectively) | 311 patients with healthcare-associated IAI (data provided for 302 patients) Median age of all groups (de-escalation, no de-escalation, escalation, and no change) ranged from 61-70 years across groups | Patients admitted for the management of healthcare-associated IAI who survived >3 days following their diagnosis, remained in the ICU for >3 days, and did not undergo early reoperation during the first 3 days | SOFA | ICU mortality: 28.8%; Hospital mortality: 30.1% |
| Morais 2018 | Portugal 2009-2017 | Retrospective cohort study | 101 patients submitted to laparostomy Median age 64 years (range 22-88) | Patients with open abdomen | APACHE II | Global in-hospital mortality: 62.4% |
| Nugraha 2022 | Indonesia 2020-2021 | Retrospective cohort study | 265 patients Mean age 42.6 years | Adults diagnosed with cIAI or suffering from secondary/tertiary peritonitis or intra-abdominal abscess who underwent source control surgery during hospitalization | SOFA | Mortality "during treatment": 34.7% |
| Ozdogan 2015 | Turkey 2010-2013 | Retrospective cohort study | 103 adults with cIAI admitted to ICU Mean age 64 years | ICU adults with cIAI sepsis | APACHE II | Overall mortality: 50.5% |
| Pan 2021 | China 2012-2019 | Retrospective review | 282 patients Mean age 57 years | Patients with intra-abdominal infection | APACHE II | Mortality: 22.7% |

| | | | | | | |
|-------------------------------|---|--|--|---|---|---|
| Pawar 2022 | USA 2008-2018 | Retrospective review | 478 patients with cholangitis/cholecystitis; 396 patients with peritonitis Median age of total cohort 70 years (IQR 57-82) | Subset of adult ICU patients with cholangitis/cholecystitis, from a broader cohort of patients with various types of infections | SOFA | Mortality: 10.3% for cholecystitis/cholangitis; 20% for peritonitis |
| Pieroni 2022 | USA 2014-2015 | Retrospective review of multicenter ICU database (335 ICUs across 208 hospitals) | 544 abdominal sepsis admissions, from a bigger cohort of sepsis admissions Mean age for abdominal sepsis group 67 years | Adults in medical ICU, surgical ICU, and medical-surgical ICU with an ICU stay >72 hours | SOFA | In-hospital mortality for abdominal sepsis: 18.9% |
| Politano 2011 | USA 13-year period; years not stated | Retrospective cohort study (data collected prospectively) | 686 patients with IAI requiring an intervention after an index operation Mean age in percutaneous drainage group 52.9 years, mean age in surgical drainage group 52.3 years | Patients with postoperative IAI requiring intervention | APACHE II | Presumably in-hospital mortality: 6.7% |
| Posadas-Calleja 2018 | Canada 2005-2010 | Multicenter retrospective cohort study (data collected prospectively) | 905 patients with intra-abdominal sepsis Mean age 64 years | Patients with intra-abdominal sepsis (met ≥ 2 SIRS criteria) | APACHE II, SOFA | Overall ICU mortality: 21.3% |
| Pupelis 2014 | Belgium 2010-2012 | Retrospective cohort study | 222 patients with secondary peritonitis Mean/Median (unclear which) age 65 years | Patients admitted to the SICU with secondary peritonitis (either localized or diffuse) | SOFA, ASA | ICU mortality: 9.9%; Hospital mortality: 14.9% |
| Roger 2022 | France 2018-2019 2014-2015 | Multicenter, prospective observational study | 205 patients Mean age 56 years | Adults diagnosed with community-acquired IAI | SOFA | 28-day mortality: 7% |
| Sartelli 2015 | 54 countries worldwide | Multicenter prospective study | 4,533 adults with cIAI sepsis Mean age 51.2 years (range 18-99) | Adults with cIAI who had surgical management or interventional radiological drainage | WSES | Overall mortality: 9.2% |
| Sim 2020 | Korea 2013-2018 | Retrospective cohort study | 239 adults who underwent emergency gastrointestinal surgery Mean/Median (unclear which) for culture positive 76 years, for culture negative 70 years | Adults with sepsis or septic shock who underwent emergency cIAI surgery and needed postoperative ICU care | SOFA, ASA | In-hospital mortality: 18%; 30-day mortality: 15.1% |
| Suarez de la Rica 2015 | Spain 2012-2013 | Multicenter, retrospective cohort study (data collected prospectively) | 121 adults with cIAI Mean 65.6 years (range 18-96) | Adults with cIAI admitted to the SICU for ≥ 48 hours in 4 Spanish hospitals | SAPS II, SOFA | Intra-SCCU mortality: 11.6% Overall mortality (28 days from SCCU admission): 18.2% |
| Tartaglia 2021 | Italy 2010-2019 | Retrospective review | 113 patients Mean age 68.1 years | Patients admitted with abdominal sepsis requiring open abdomen | APACHE II, ASA | In-hospital mortality (during treatment or within 30 days of treatment): 43.4% |
| Tellor 2015 | USA 2005-2011 | Retrospective cohort study | 108 patients with IAI BSI Median age 60 years | Patients with severe sepsis because of cIAI | Modified APACHE II that didn't include Glasgow coma scale | Overall mortality: 27.8% |
| Wu 2016 | China 2013-2014 | Retrospective study (data collected prospectively) | 267 adults with IAI Mean age 49.5 years | Adults >18 years with IAI | APACHE II, SOFA | ICU mortality: 7.87%; 28-day mortality: 9.0% |
